Date of sampling and testing		If more than one date is applicable to sampling or testing they should be indicated against the individual test results						
Product description 1. Dimensional tolerances		Slate for roofing and external cladding or carbonate slate for roofing and external cladding.						
		Slate type and origin						
Length and width		Maximum deviation ± 5mm						
Deviation from squareness		Maximum deviation \pm 1% of the length						
Deviation from straightness of edges		Slate length ≤ 500mm Permitted deviation ≤ 5mm						
		Slate length > 500mm Permitted deviation \leq 1% of the length						
		Slate type Maximum deviation from flatness as a % of the slate length						
Flatness : The limits of deviation from the flatness are defined for four types of slate. The bevelled edges shall be applied to the convex face. Slates with deviation from flatness in excess of the limit may be used for special applications.		Very flat	< 0.9					
		Flat	< 1.0					
		Normal	< 1.5					
		Non-flat	< 2.0					
3. Strength:	Longitudinal and transver the basic nominal thichne climate conditions and tra	ess is determine	d as a functio	n of the bend st				
el = X_{γ} and et = X_{γ}		 el is the longitudinal thickness, (in mm); et is the transverse thickness, (in mm); <i>I</i> is the length of the slate, (in mm); <i>b</i> is the width of the slate, (in mm); Rcl is the characteristic longitudinal modulus of rupture, (in N/mm²); Rct is the characteristic transverse modulus of rupture, (in N/mm²); X is a constant determined as a function of climate and the traditional construction techniques (in N¹/₂.mm⁻¹/₂). NOTE: It may be different for each formula and is selected for the member state of use according to the table below. 						
National X Factors:		Member state	Transverse	Longitudinal	Member state	Transverse	Longitudinal	
		Belgium	1.0	1.0	Czech Repub.		1.2	
		Ireland	0.9	1.1	Italy	1.2	1.2	
		France	1.0	1.0	Spain	1.0	1.0	
		Germany	1.2	1.2	UK	0.9	1.1	
climate and tradi	states that have not declar tional construction technic ermined by using the leng	ques. It should n	ot be less tha	n the minimum	value or pair of	values given a	above.	

er and et are determined by using the rength / and the width b of the slates. The maximum value determined is the basic individual thickness of the slate, ebi. The basic individual thickness is increased in relation to the slates performance in the appropriate sulphur dioxide test as shown in 7 and 8 below.

. Water Absorb			EN 12326-1:2014 Page 3 of 4				
4. Water Absorption:5. Freeze-thaw test:		Code W1 (≤0.6), W1 (>0.6), or W2 Slates tested indicate the mean value of the modulus of rupture after 50 cycles in transverse and longitudinal directions before and after the freeze/thaw test, if relevent, (test (if W1(>0.6)), or not required.					
6. Thermal cycle	e test:	The following	table explains the meaning of	he test codes			
Code		Observa	tion in the test	Conformity to the standa			
T1	No changes in appearance that neither affect the structure of the structur	dation of metallic minerals. Col runs of discolouration.	s. Colour changes Acceptable				
T2	Oxidation or appearance changes of the metallic inclusions with runs of discolouration but without structural changes.				Acceptable		
Т3	Oxidation or appearance changes of the metallic minerals which penetrate the and risk the formation of holes.			rate the slate	Acceptable subject to the note below		
			potentially may result in water es showing exfoliation splitting				
7. Apparent calcium carbonate content:		There is no limit on apparent calcium carbonate content. However, the apparent calciu carbonate content determines which sulfur dioxide exposure test procedure should be carried out and, together with the strength, the minimum nominal thickness of the product. If the carbonate content is less than or equal to 20% then the sulfur dioxide exposure test procedure in EN 12326-2:2011, 14.1 applies. If the carbonate content is more than 20%, the sulfur dioxide exposure test procedure in EN 12326-2:2011, 14.1 applies. If the carbonate content is more than 20%, the sulfur dioxide exposure test procedure in EN 12326-2:2011, 14.2 applies. The minimum thickness is calculated using the table below.					
		test procedure 20%, the sulfu	n EN 12326-2:2011, 14.1 ap Ir dioxide exposure test proced	olies. If the carb lure in EN 1232	oonate content is more that

CE Marking

Welsh Slate roofing products conform to the requirements of the CE mark.

The following table provides the necessary information required to demonstrate conformity of

Cwt-y-Bugail Capital Roofing Slate

Welsh Slate Ltd, Penrhyn Quarry, Bethesda, Near Bangor, Gwynedd, Wales, UK, LL57 4YG				
12				
001CQ-DoP2014-11-03				
EN 12326-1:2014				
Cwt-y-Bugail Capital				
Intended to be used as discontinuous roofing and external cladding				
Dimensional variation				
Nominal thickness	5.5mm			
Individual thickness	5.5mm (< +/- 35%)			
Deviation of length and width	Complies			
Deviation of edge straightness	Complies			
Deviation of rectangularity	Complies			
Mechanical resistance (Characteristic modulus of rupture)				
Transverse	38.7 N/mm²			
Longitudinal	77.8 N/mm²			
Water permeability - water absorption	W1 (≤0.6%)			
Apparent calcium carbonate content	≤ 5%			
Durability				
Water absorption	W1 (≤0.6%)			
Freeze-thaw cycling	Not required			
Thermal cycling	T1			
Sulfur dioxide exposure	S1			
Non-carbonate carbon content Complies: ≤ 2%				
Release of dangerous substances: None in conditions of use as roofing or external cladding				
External fire performance: Deemed to satisfy
